OBJECTIVE

Backend-focused Full-Stack Developer with hands-on experience building production REST APIs, multi-tenant systems, and AI-integrated applications using Node.js, TypeScript, and Django. Strong in clean architecture, database design, and end-to-end feature delivery.

EDUCATION

B.Sc. in Computer Science and Engineering (2025)

Dhaka

Jagannath University

- CGPA: 3.53

SKILLS

Programming Languages

C++, JavaScript, TypeScript, Python, Ruby

Version Control Systems

Git & GitHub

Database Management

MySQL, PostgreSQL, MongoDB

Deployment

Netlify, Vercel, github-pages, Render

Web Development

HTML5, CSS3, React JS, Next JS, Node JS, Express JS, Nest JS, Django, Docker, Bootstrap, Tailwind CSS, Shadcn UI, Material UI

EXPERIENCES

Full-Stack Developer Intern

06/2026 – Present

Periscale AI

Remote

- Developed full-stack features for a SaaS CRM platform using Django (backend) and React/TypeScript (frontend), shipping production code across the stack
- Built a complete courier provider integration end-to-end — designed backend services, implemented webhook handlers with signature verification, and created the frontend UI including cascading location typeaheads and API integration
- Redesigned a core Orders & Finance workflow page into role-specific views, improving usability for different team functions
- Diagnosed and fixed a shared state bug affecting UI feedback across multiple integration cards, isolating it with a scoped state pattern

PROJECTS

ShopSphere_A-Complete-World-for-Shopping

- GitHub (Frontend) | GitHub (Backend) | Server | Client
- Used: TypeScript, Express.js, Node.js, MongoDB, Swagger UI, JWT Authentication
- Role-based REST API (Admin/Seller/Buyer) with JWT auth, secure session management, and full CRUD - products, cart, wishlist, orders, coupons, refunds, reviews, revenue analytics
- Built competitor price scraper using Puppeteer (headless Chrome) for JS-rendered sites - debugged CSS selectors, parsed prices via regex, and designed environment-aware fallback to Cheerio + internal APIs on production to handle anti-bot restrictions
- Pricing suggestion engine comparing seller price vs. market average with percentage-based recommendation logic
- Payment integration (Stripe, PayPal, COD); security via Helmet, rate limiting, CORS, Zod validation, Winston logging
- Full OpenAPI 3.0 Swagger documentation

Financial-Tracker-Suite

- GitHub (Backend) | GitHub (Frontend) | Server | Client
- Used: Node.js, Express.js, MongoDB, Mongoose, JWT, Swagger UI, Nodemailer, PDFKit
- Developed secure RESTful API with JWT authentication, bcrypt password hashing, and automated email notifications for user verification and password reset functionality

- Implemented transaction management system with CRUD operations, automatic balance calculations, advanced filtering by type and date range, and automated PDF report generation using PDFKit
- Built real-time financial analytics endpoints providing daily/monthly/yearly summaries with custom date ranges (Moment.js) and integrated comprehensive Swagger documentation for API testing

Multi-Tenant Organization Workspace API

- [GitHub \(Frontend\)](#) | [GitHub \(Backend\)](#) | [Server](#) | [Client](#)
- Built with: TypeScript, Node.js, Express.js, PostgreSQL, Prisma ORM, JWT, Zod, Swagger UI
- Developed a secure, production-ready multi-tenant REST API with strict tenant isolation for organization workspaces
- Implemented role-based access control using JWT for Platform Admin, Organization Admin, and Organization Member roles
- Built core features including organization, user, project, and task management with enforced organization-level boundaries
- Designed an ACID-compliant PostgreSQL schema with foreign keys, transactions, and indexed tenant filtering for data integrity
- Documented the API with Swagger UI and provided a ready-to-use Postman collection; deployed on Render with automated migrations

ExpenseBot - AI-Powered Telegram Expense Tracker

- [GitHub \(Backend\)](#) | [GitHub \(Frontend\)](#) | [Live Bot](#) | [Dashboard](#)
- Built with: TypeScript, Node.js, Express.js, PostgreSQL, Prisma ORM, Neon DB, React, Tailwind CSS
- Telegram bot that parses natural language expenses ("500 uber yesterday") using Google Gemini AI with keyword-matching fallback for zero-latency common inputs
- Clean architecture with separate repository, service, and controller layers per module
- JWT authentication, Zod validation, Winston logging, rate limiting, and Helmet security
- Real-time budget alerts sent via Telegram when monthly spending crosses user-defined threshold
- React dashboard with Chart.js doughnut charts, budget progress tracking, and expense management
